

Your Bankers, With the Follow-Through of a Thousand

The Lyzr Agentic Workbench for Retail Banking — AI agents that watch the signals already in your data, prepare the work your team never has time for, and complete the follow-through, with your bankers always in the lead.

1 The Problem You Already Know

Your institution's advantage has always been relationship depth. Yet the industry numbers describe a machine that cannot act on what it sees: the average institution holds about **2.3 of the ~7 financial products** its households own, **two-thirds of digital account applications are abandoned** before an account exists, and roughly **90% of deposit attrition never appears in standard reporting** — balances drain quietly while reports count only closed accounts.

None of this is a data problem. Every one of these events is visible in data you already own — a direct deposit that stops, a competitor's loan payment appearing in a checking account, a CD maturity approaching, an application stalling at identity verification. It is a **follow-through problem**: your bankers spend most of their day reconciling systems and writing things up, and the signals decay before anyone can act. Cross-sell becomes what a banker does when the queue is empty. The queue is never empty.

2.3 / ~7

products captured vs. held per household
— wallet you own the relationship to, but
don't collect

of digital applications abandoned — the
young customers you want most, lost at
the door

5–25x

cheaper to deepen an existing
relationship than acquire a new one
(~\$561/customer, ~\$428/member)

2 What the Workbench Does

The Lyzr Agentic Workbench gives every retail banker a single surface — one inbox of live opportunities, each arriving pre-researched, pre-qualified, and compliance-checked. Behind that surface, specialized AI agents run a continuous loop over your existing systems:

Step	What happens
Sense	Agents watch your core, digital banking, and interaction data continuously — no data-warehouse project required. They work with your data as it is.
Judge	Every detected opportunity passes a genuine-need test before anyone acts: is this right for this customer, at fair value, right now? The rationale is logged, every time.
Engage	High-value moments reach your bankers as a one-page brief — context, why-now, talking points, pre-qualified terms. Routine digital moments can execute directly, within limits you set.
Execute	When the customer says yes, the agents finish the job: account opened from KYC on file, direct deposit switched, documents chased, CRM notes written. Nothing dies in a queue.
Learn	Every outcome sharpens detection and gives your managers a live view of the pipeline — including which opportunities are about to expire untouched.

Your bankers stay in the lead for every relationship moment. The agents do everything that was keeping them from those moments.

3 The Flagship Agents

Deposit Defense

Sees the silent attrition your reports can't — direct-deposit loss, drain velocity, soft-switching patterns — and acts inside the window: a personalized, compliance-checked retention play, with high-value saves escalated to your bankers with full context and a suggested opening line. Priced per deposit dollar retained.

Onboarding Rescue & 60-Day Primacy

Catches abandoning applicants in real time, clears resolvable verification exceptions in minutes, and re-engages before they're gone. Once the account opens, it runs the first 60 days as a managed journey — direct deposit, card activation, bill pay — the window in which primacy is won or lost. Priced per activated account.

Life-Event Cross-Sell

Reads the signals your customers are already sending — a competitor mortgage payment, a payroll change, a large idle balance — and turns each into a fitted, fair-value-documented conversation for your banker, or a compliant digital offer where that's what the customer prefers. Priced per product added.

Maturity & Rate-Watch

Every CD maturity, promo roll-off, and loan payoff, worked ahead of the customer's shopping window with renew, upgrade, or consolidate options priced within your treasury's bounds — the most predictable revenue moment in banking, finally handled like one.

Business-Banking Graduation

Finds the businesses hiding inside your retail accounts — invoicing income, merchant fees, fintech tool spend — and hands your business banker a pre-assembled file and a warm introduction. The stickiest deposits you can gather, from relationships you already hold.

The Banker's Day, Returned

Underneath the revenue agents: a pre-meeting brief for every appointment, live product knowledge with citations during every conversation, and automatic notes, follow-ups, and referral tracking after it. The hours your team spends on five systems come back as customer time.

4 Governance Isn't a Feature. It's the Foundation.

Everything the agents do is examinable by design, because we build for regulated institutions first:

- **A genuine-need gate on every offer.** No action reaches a customer without a logged suitability and fair-value rationale — your evidence under Consumer Duty, UDAAP expectations, and the EU AI Act, generated automatically.
- **Your autonomy dial.** Every agent runs at the level you set — from "brief my banker" to "act within these bounds and show me the log." Vulnerable customers, complaints, and high-value decisions always route to a human. Always.
- **A replayable audit trail.** Every decision, approval, and outcome in an append-only log; examiner documentation packs assembled on demand, not the week before the exam.
- **Conduct protection built in.** Continuous monitoring for sales-practice risk patterns — the workbench is structurally designed to make the next Wells-Fargo-style failure impossible, not just unlikely.

Our goal is simple: your compliance officer should be this product's biggest champion.

5 How an Engagement Works

Format	What you get
Fixed scope, 60–90 days	One agent, one measurable outcome, live in production — not a platform program, not a pilot that never ends. We start where your money is leaking fastest (most institutions start with Deposit Defense).
Outcome-metered pricing	Per deposit dollar saved, per activated account, per product added — with the measurement methodology published up front. If it doesn't move the number, you don't pay for the number.
No data prerequisites	We connect to your core and digital banking systems as they are and do the enrichment ourselves. Your data doesn't need to be ready. It needs to be yours.
Expansion on evidence	Each agent you add shares the same customer state, signals, and audit spine — the workbench assembles itself as the results come in.

The ask: a 45-minute working session with your retail and compliance leadership, and a look at one month of your own attrition or onboarding numbers. We'll show you exactly what the agents would have caught.
